JavaScript Homework Assignment: Adventure Character Creator

Week 2 project

Overview You will build an interactive program that uses pop-up dialogs to let a user create a fantasy character. Follow the steps below. For each question step, you are given:

- The **text** the dialog should display
- Which function to use (alert, prompt, or confirm)
- The **variable name** you must use

You may use double spacing, single spacing, or backticks but be sure to concatenate the data where it's needed appropriately.

Required Files Create a folder called **character** with:

- index.html (use the starter code below)
- character.js (your script)

Starter index.html:

HTML

```
<!DOCTYPE html>

<html lang="en">

<head>

  <meta charset="UTF-8">

  <title>Adventure Character Creator</title>

    <!-- Scripts go here, with defer -->

  <script src="character.js" defer></script>

</head>

<body>

  <h1>Adventure Character Creator </h1>

  <p>Answer the popups — your hero story appears at the end!</p>

</body></html>
```

Step-by-Step Requirements (write these in character.js)

1. **Welcome message**
    - Use: alert
    - Text: **"Welcome to the Adventure Realm! Let's create your hero!"**
2. **Character name**
    - Use: prompt
    - Question text: **"What is your character's name?"**
    - Store the answer in: **const characterName**
3. **Pet / companion**
    - Use: prompt
    - Question text **: (`What kind of pet does ${characterName} have? (dragon, wolf, robot, unicorn, phoenix, etc.)` , "dragon");**
    - Use a template literal so the actual name appears
    - Store in: **const pet**
4. **Superpower**
    - Use: prompt
    - Question text: **"What is [character's name]'s special superpower?"**
    - Store in: **const superpower**
5. **Likes fighting monsters**
    - Use: confirm
    - Question text: const likesFighting = confirm(` Does ${characterName} like fighting monsters?
        - Click OK for YES
        - Click Cancel for NO`);
    - The text above uses a template literal with backticks.
    - Store the true/false result in: **const likesFighting**

6. **Loading / preparing message**
    - Use: alert
    - Text: "**Gathering magic for [character's name]... almost ready!"**

7. **Final character story**
   - Use: alert
   - Display a multi-line summary using a template literal with real line breaks

     Include at minimum:
   - **Header lines (e.g. ==========)**
   - **Labels and values:**
   - **Name: ${characterName}**
   - **Pet: ${pet}**
   - **Superpower: ${superpower}**
   - **Monster fighter? followed by "Yes" or "No" (use ${likesFighting ? "Yes" : "No"})**
   - **1–2 short story sentences using the name, pet, and superpower (e.g. "In a faraway land, [name] rides a mighty [pet], wielding the incredible power of [superpower]!")**
   - **Closing divider line .(==========)**
   - ⍰ Make it look organized and readable (add spaces, new lines as needed)

<u>Possible example result for the final story:</u>

Your Adventure Hero

==========

Name: ${characterName}

Pet: ${pet}

Superpower: ${superpower}

Monster fighter? ${likesFighting ? "Yes " : "No "}

In a faraway land, ${characterName} rides a mighty ${pet},

wielding the incredible power of ${superpower}!

The realm awaits your legend...

==========`);

Tips

Use backticks ` for all questions and the final alert so you can easily insert variables with ${} and add line breaks by pressing Enter.

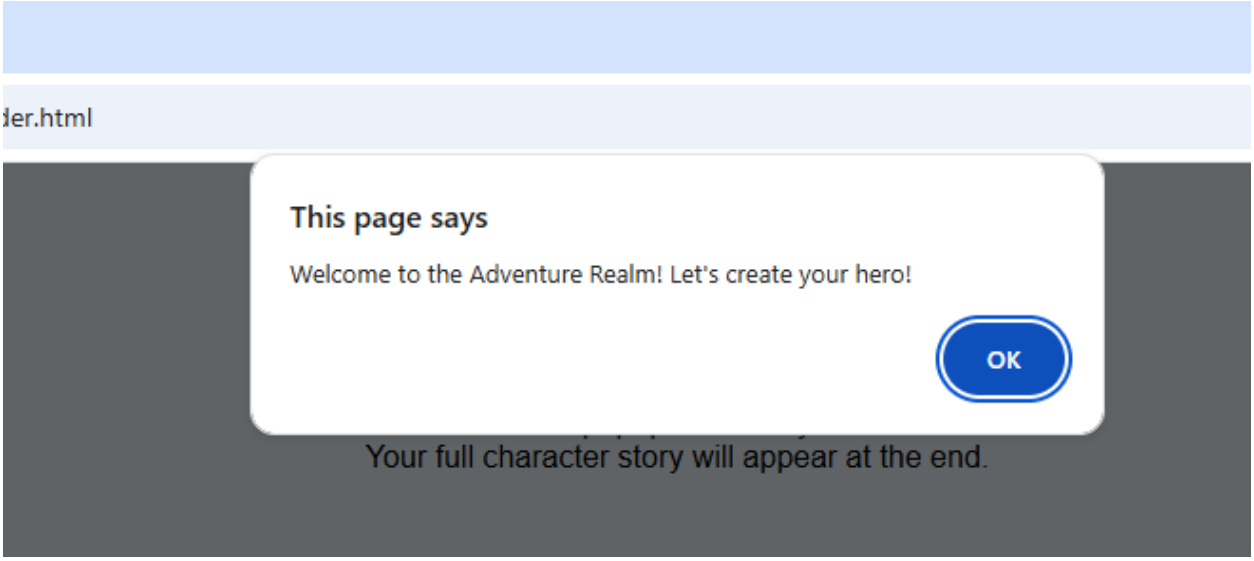
Test after each step: save, refresh the browser, and check that popups appear correctly.

Quick test checklist

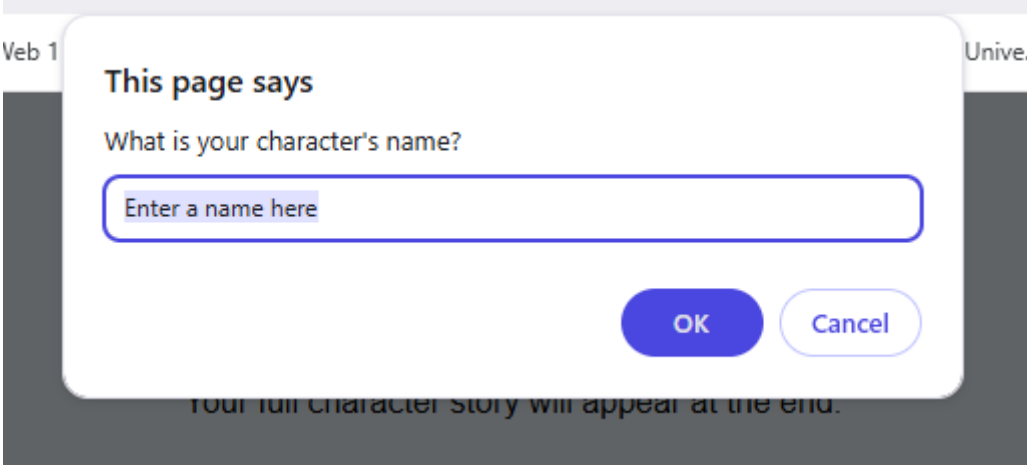
1. Save both index.html and character.js
2. Open index.html in a browser
3. Answer all popups
4. Verify that:
    - The name appears correctly in later questions
    - Prompts and confirm show line breaks where intended
    - Final alert is nicely formatted with all values

This is a possible result of your project:

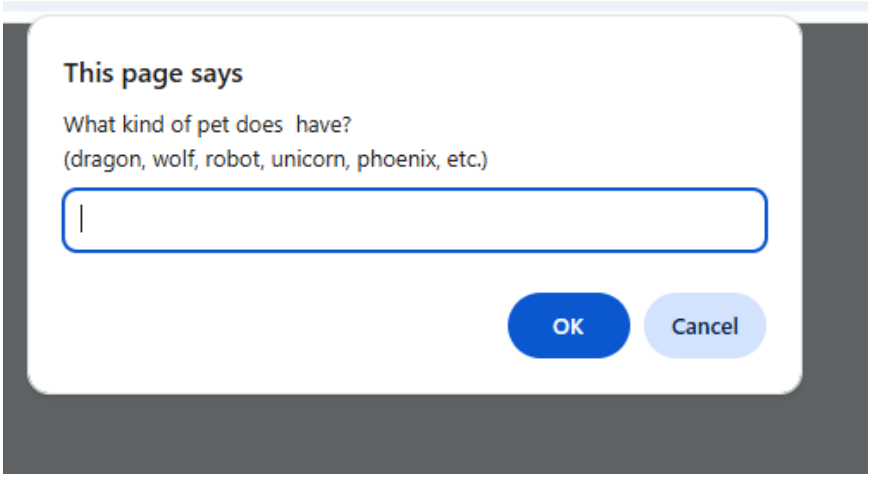
After Step 1:



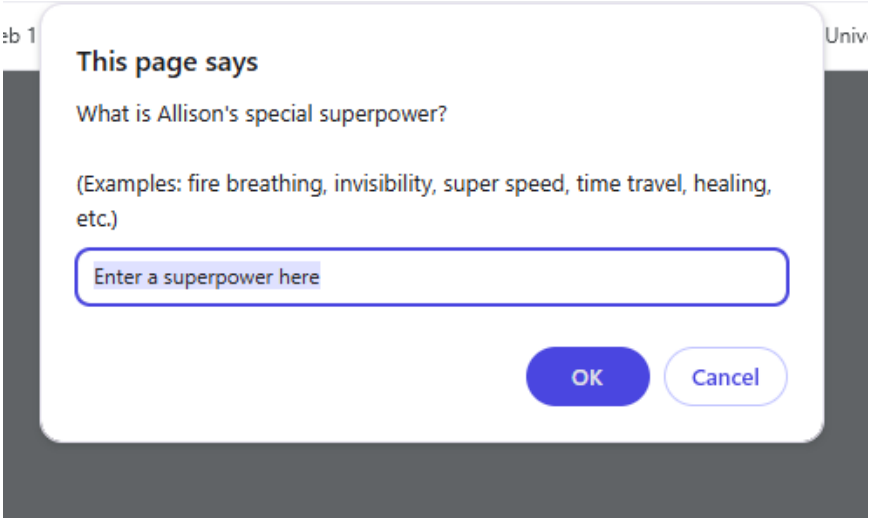
After Step 2:



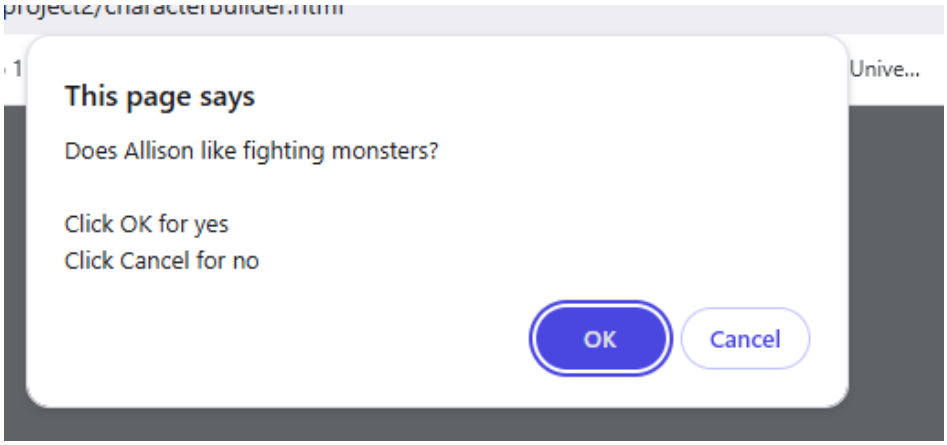
After Step 3:



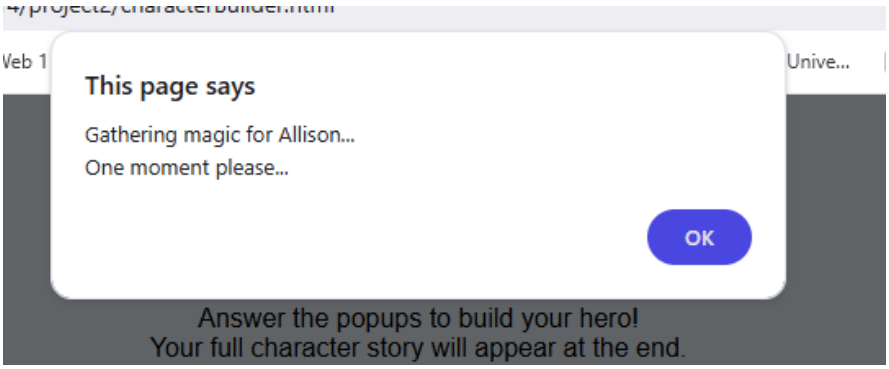
After Step 4:



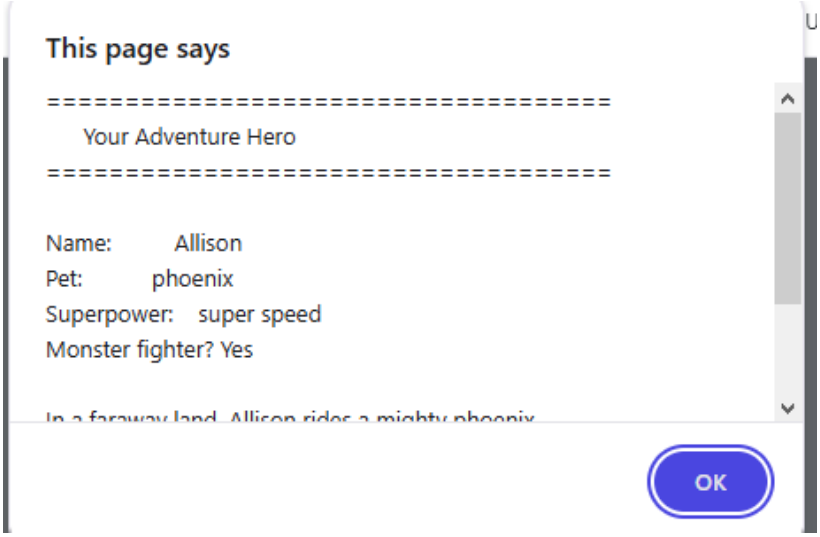
After Step 5:

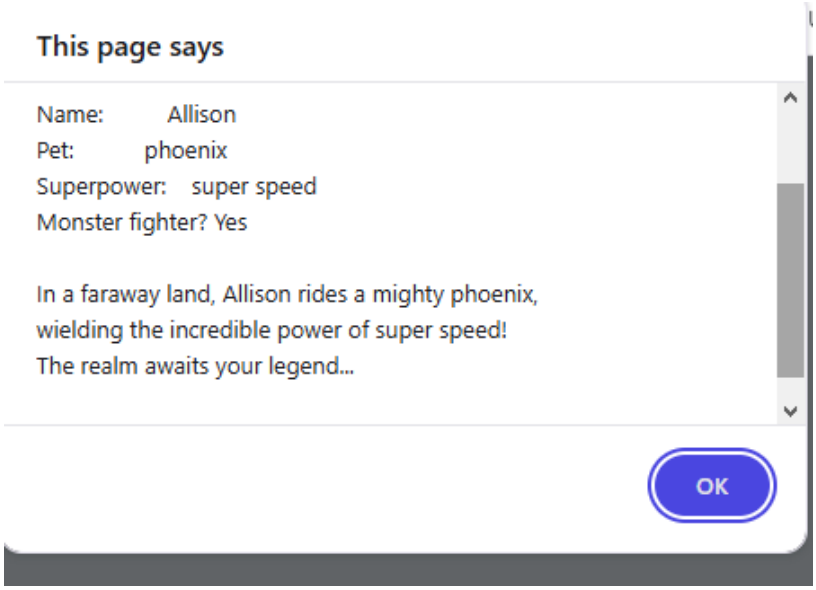


After Step 6:

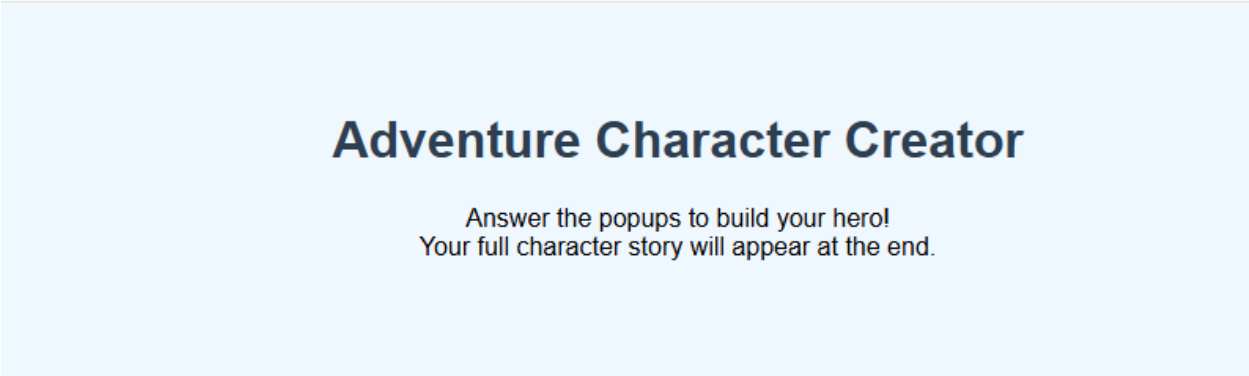


After Step 7:





The page once all the pop-up windows are done.



Submitting the Project

Upload the two files (index.html and character.js) to GitHub and link them to projects template file located in Canvas. The index.html will be linked to Week 2 project.

Your link in GitHub will look something like this:

https://[username}.github.io/[name of repository]/index.html

My link looks like: https://allisonjccc.github.io/WEB114/index.html

Submit this link to the Canvas drop box for the Project 2 assignment.

Congratulations! You are building some great JS muscles.
