Build an Interactive Add a Person Form using JS and DOM Objects

Use the object.html file as a base file that you can download in the Canvas module to build with JavaScript DOM objects and create a form that displays a person's information.

STEP 0: Download the object.html file.

- Download the object.html file in Canvas and look at the form input field ids. This is how the user will input their data.
- There is also a section of boxes with ids like: "name" and "age" where the data will be shown once the person clicks the submit button.
- Lastly, there are two sections with ids of "message" and "greeting". Customized messages to give the user feedback once they click submit will appear there.

They will be used to connect to JavaScript DOM objects.

STEP 1: Set Up Your Default Data

Create a new js file called objects.js

Create an object that stores a person's information.

- Create a variable called person
- Store these properties inside it:
    - first name
    - last name
    - age
    - city
    - favorite color

Checkpoint:

Your object should hold all 5 values. An example could be:

```
let person = {
fname: "Mary",
lname: "Smith",
age: 25,
city: "Kansas City",
favoriteColor: "Green"};
```

STEP 2: Connect JavaScript to HTML

Grab all needed HTML elements.

Use document.querySelector() to select:

- first name input

```
const fnameForm = document.querySelector("#fnameInput");
```

- **Continue adding these inputs:**
- last name input
- age input
- city input
- color input

- All display elements:
  // These are DISPLAY elements (where data shows on the page)
- **const ageForm = document.querySelector("#age");**

  Continue adding these display elements in varaibles:

  - name display
  - age display
  - city display
  - color display
- Message areas:
  // Message area (for feedback to user)

  - message box
  - greeting box
- The form itself

Checkpoint:

Every HTML element you will use must be stored in a variable

STEP 3: Create a Display Function

// This function takes a person object and displays it on the page at the top

Create a function called:

showPersonInfo(personObject){

Inside the function:

- ShowPersonInfo is the name of the function.
- personObject is an Object.
  - JavaScript objects are containers that store related information using key–value pairs (for example, a "person" object might store a name, age, and favorite color). They help organize data so you can easily access or update specific pieces using the key, like `person.name`.
- Update the page with:
  - full name (first + last)
    `nameDisplay.textContent = `${personObject.fname} ${personObject.lname}`;`
  - age

`age.textContent = personObject.age;`

Continue coding these elements:

- city
- favorite color
- Close the function

STEP 4: Show Default Person on Page Load

```
Call the function to display the default person when the page loads
// Runs the function when the page loads
```

- **`showPersonInfo(person);`**
  - `ShowPersonInfo is the name of the function above. The name in the (person) is an argument that was created in step 1.`

Checkpoint:

The page should show the default person info at the top of the page.

STEP 5: Create an EventListener to handle user input

Run code when the user submits the form.

- Add a submit event listener to the form

- Create a function inside it
    - **`form.addEventListener("submit", function(submitForm){`**
    - `Submit is the action to listen for`
    - `SubmitForm is the name of the function to run when the submit button is clicked.`
- Stop the page from refreshing using preventDefault()
    - **`submitForm.preventDefault();`**

Submitting the form should NOT refresh the page so that the form can do something with the information submitted.

STEP 6: Build a New Person Object inside the function

```
Create a new person object using values from the form
// Create a new object using the user's input
```

Inside the event listener:

- Create a new object called newPerson
- Fill it with values from the form inputs

```
const newPerson =
        {
    fname: fnameForm.value,          // Get first name from
    lname: lnameForm.value,          input // Get last name from
                                     input
```

- Convert age into a number
    - **`age: Number(ageInput.value), // Get age`**
- Add the city input
- Add the favorite Color input
- Close the function

Checkpoint:

The object should match the structure of your default person

STEP 7: Update the Page with New Person's information

Display the new person's information.

- Call your display function again
- Pass in the new object
    - **`showPersonInfo(newPerson);`**

- Notice that this time we are passing an argument called newPerson because this is the newly submitted person's information.

Checkpoint:

The page should update immediately when form is submitted

STEP 8: Show a confirmation message and greeting

```
// Display confirmation message
```

- Set a message like:
  - "A new person has been added!"

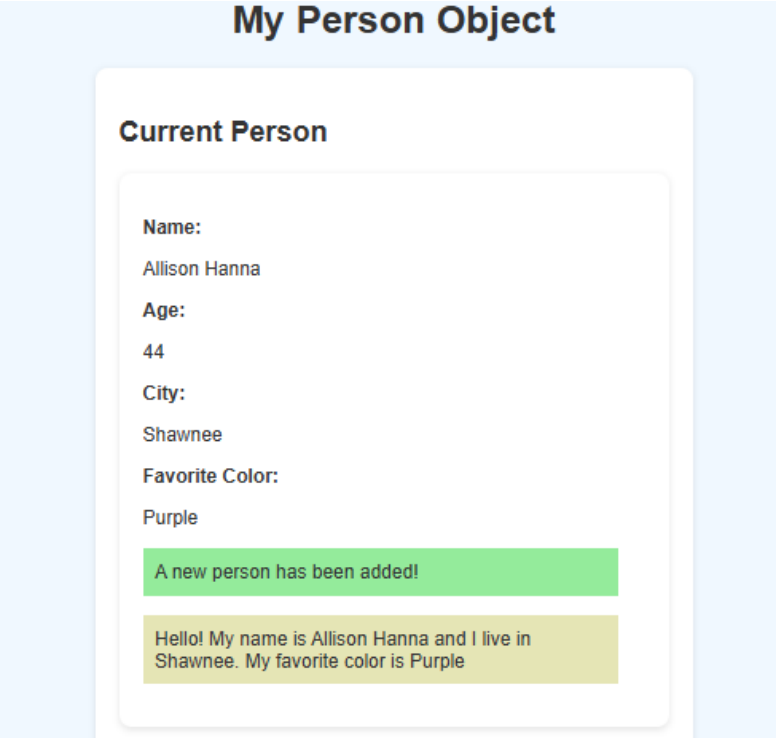
    ```
    message.textContent = "A new person has been added!";
    ```

- Change its background color

  ```
  message.style.backgroundColor = "#94eb9b";
  ```

Checkpoint:

A personalized message and greeting appears on the page.



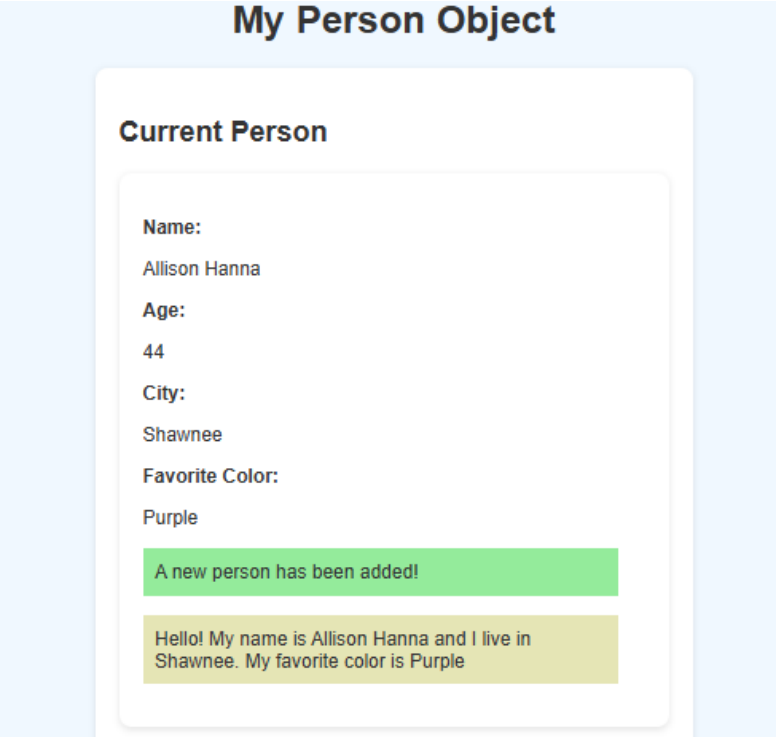
STEP 9: Create a Greeting Message

Display a personalized message.

- Use template literals to build a sentence like:
    - `Hello! My name is ___ and I live in ___. My favorite color is ____`
- **Use greeting.textContent = `Hello! My name is ${newPerson.fname} ${newPerson.lname} and I live in ${newPerson.city}. My favorite color is ${newPerson.favoriteColor}`;**
- Change greeting background color (see the message color for an example)

Checkpoint:

Greeting should update with each submission



STEP 10: Add Age Check Logic

Use a decision (if/else).

- If age is less than 18:
    - show alert “minor”
- Otherwise:
    - show alert “adult”

Checkpoint:

One alert should always appear after submission

STEP 11: Reset the Form

Clear the form for next entry.

- Reset the form at the end of the event listener

Checkpoint:

Inputs should clear after submitting

Final Checklist

When finished, your program should:

✓ Show default person on load
✓ Accept new user input
✓ Update the page dynamically
✓ Show messages + greeting
✓ Check age with logic
✓ Reset form for reuse

My Person Object

Current Person

Name:

Allison Hanna

Age:

44

City:

Shawnee

Favorite Color:

Purple

A new person has been added!

Hello! My name is Allison Hanna and I live in Shawnee. My favorite color is Purple
