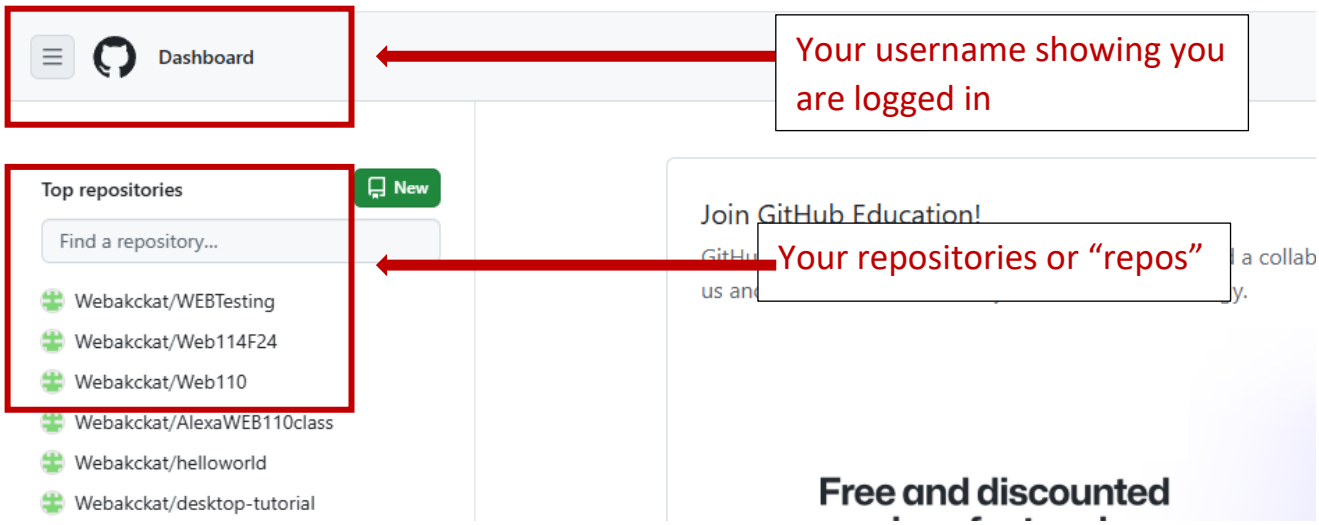
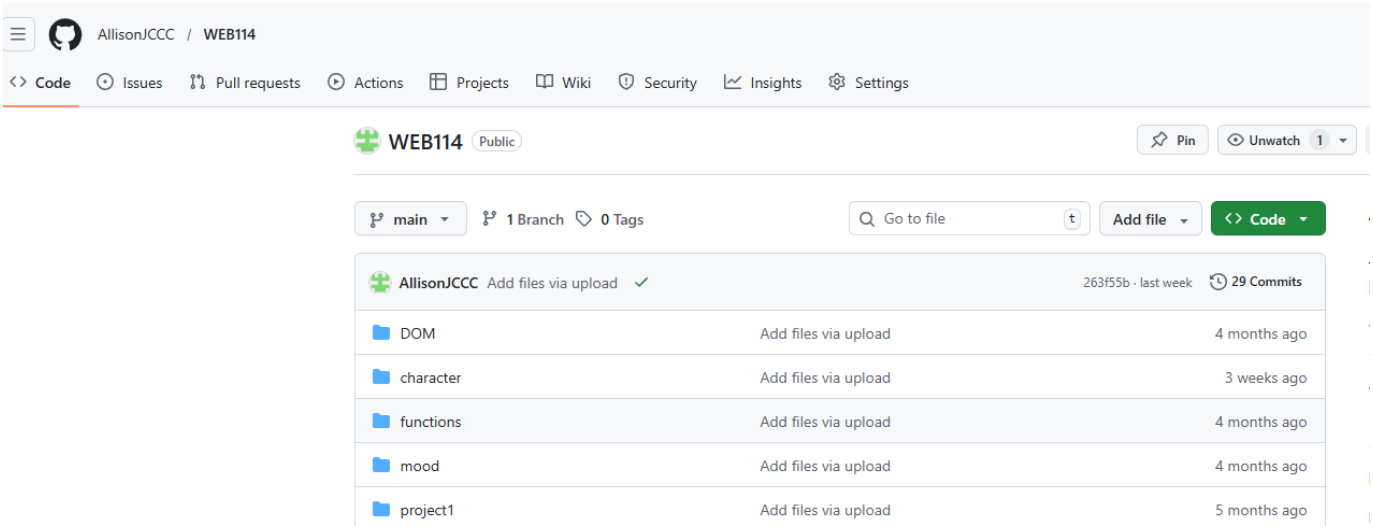
Details on how GitHub creates a URL/Web page:

Our class will use GitHub to upload the web pages you create. Once you create a web folder and connect to GitHub, you will see this picture:



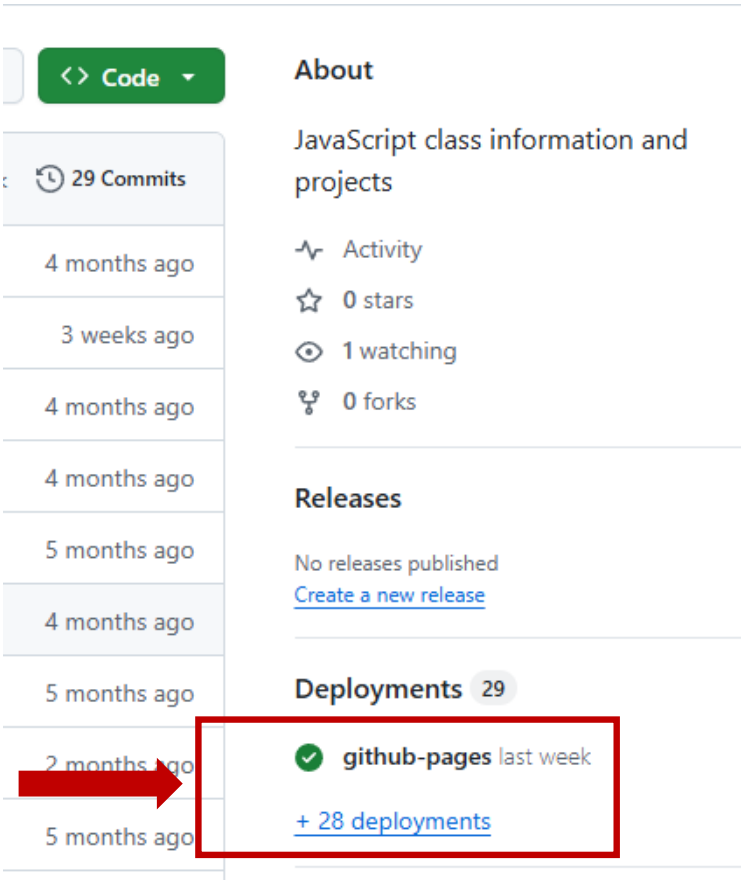
Clicking on your repo for this class, you will see this picture:



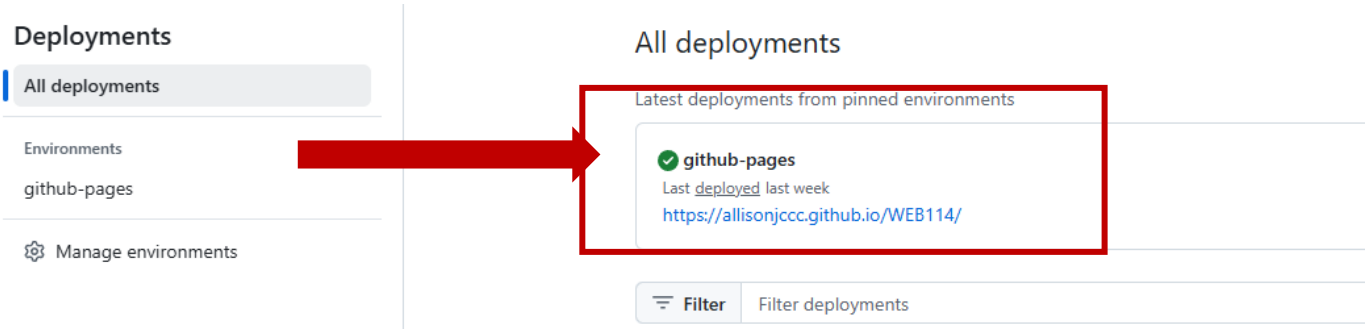
These are folders and files in your repo (our web folder) and this is where you will upload your projects for each chapter. Consider them your website files and folders.

Once you upload your files and folders, they are converted to web URLs that you can find online.

Your unique website link can be found by clicking on the Deployments link in the lower right corner of your dashboard. Here is a picture of it:

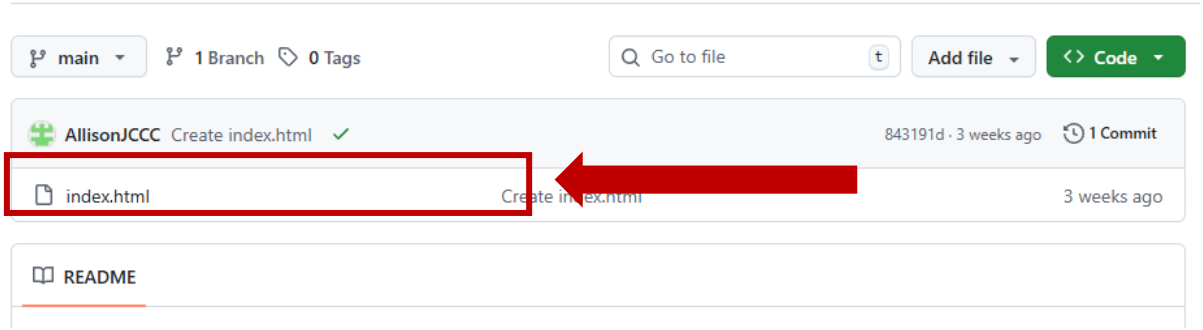


After clicking on Deployments, you will see your website URL:



All GitHub URLs start with username.github.io/Web114

Each folder or file uploaded to your repo will add a "/" to the end of the link above.



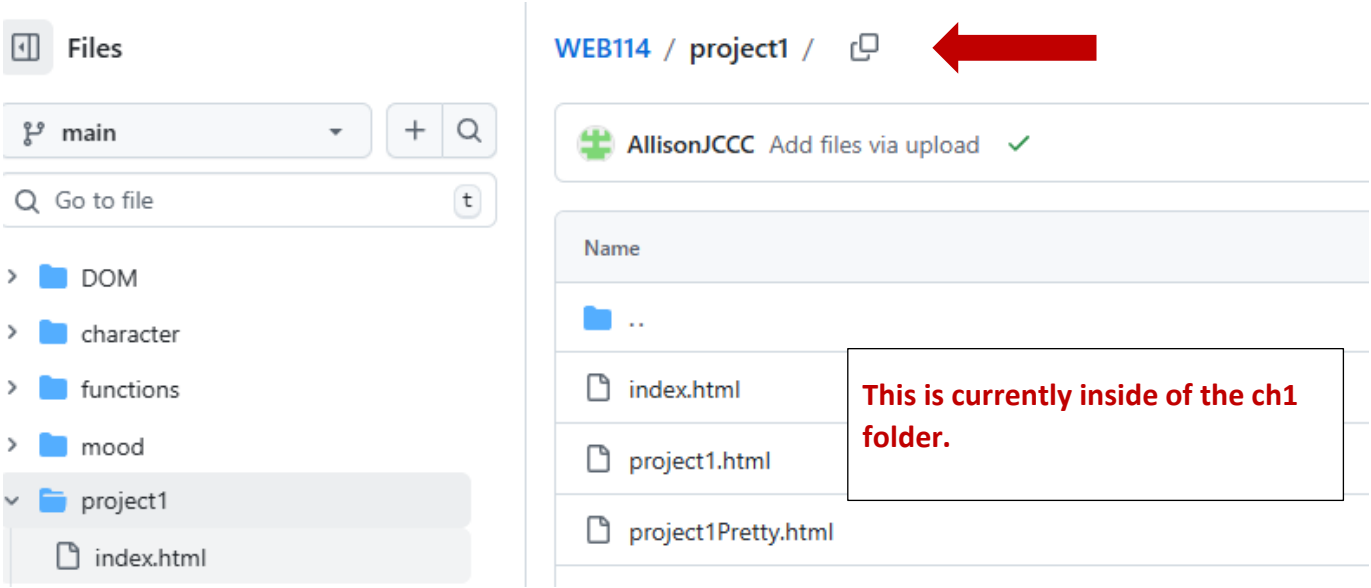
For example, the index.html file in your repo would convert to this URL:

https:// [your username].github.io/Web114/index.html

My URL would be:

https://allisonjccc.github.io/Web114/index.html

If you upload a folder to GitHub with a file in it (see picture below)



Your URL would be:

https:// [your username].github.io/Web114/foldername/project1.html

My URL would be:

https://allisonjccc.github.io/WEB114/project1/index.html

IMPORTANT: A WEB DEVELOPER "BEST PRACTICE" IS TO NAME ALL WEB FOLDERS AND FILES USING LOWERCASE WITHOUT SPACES.
